### Robust control of the inverted pendulum - ResearchGate

According to control purposes of inverted pendulum, the control of inverted pendulum can be divided into three aspects. The first aspect that is widely researched is the swing-up control of inverted pendulum [1, 2]. The second aspect is the stabilization of the inverted pendulum [3-4]. The third aspect is tracking control of the inverted pendulum [5].

The control strategies such as LQR and robust control is used to overcome the Inverted Pendulum problem. Robust control scheme used in this paper is a Linear Quadratic Regulator Tracking Controller with a FeedForward controller. Performance of the pendulum's angle and cart's position is assessed and presented.

### Inverted Pendulum Control System - LinkedIn SlideShare

The inverted pendulum is a system that has a cart which is programmed to balance a pendulum as shown by a basic block diagram in Figure 1. This system is adherently instable since even the slightest disturbance would cause the pendulum to start falling. Thus some sort of control is necessary to maintain a balanced pendulum.

### THE INVERTED PENDULUM - Cornell University

Robust design of a triple inverted pendulum control system is discussed in this chapter. The triple inverted pendulum is an interesting control system that resembles many features found in, for instance, walking robots and flexible space structures, and other industrial applications.

Robust computer control of an inverted pendulum Abstract: This article illustrates the design of a robust digital controller using a blend of state space and frequency response methods. The specific application is that of balancing an inverted pendulum on a moving cart while controlling the cart position.

We need to keep the pendulum upright while moving the cart to a new position or when the pendulum is nudged forward (impulse disturbance ). Control Structure. The upright position is an unstable equilibrium for the inverted pendulum. The unstable nature of the plant makes the control task more challenging.

The robust generalized dynamic inversion control is designed in two stages; in the first stage, constraint differential equations of the controlled state variables are prescribed, which encompasses the control objectives. To enforce the constraint dynamics, the equivalent control is realized by means of Moore-Penrose generalized inversion.
